Olympia – With CS9 – Revised Testing following TfL Audit

1. INTRODUCTION

This technical note (TN) details the VISSIM modelling undertaken for Momentum Transport Consultancy for the proposed Olympia Exhibition Centre development in Hammersmith, London.

The VISSIM modelling has been based on Transport for London's (TfL's) model of Hammersmith, which has been used to test the Cycle Superhighways proposals (CS9) in the area.

The model extents are shown in **Figure 1**.

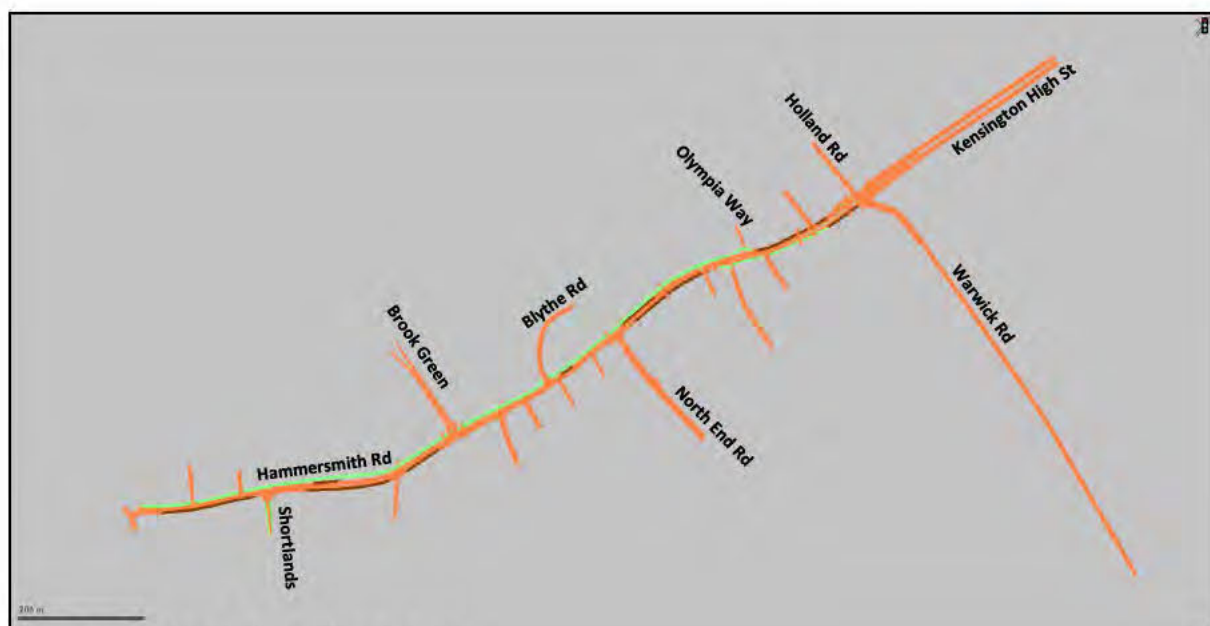

Figure 1 – VISSIM Modelling Extents

This TN builds upon the following TNs:

- TN1 – which detailed initial VISSIM assessment for the Olympia development.
- TN2 – which detailed revised testing following changes to some of the flow assumptions and scenarios tested.

It should also be noted that all of the analysis and assessment detailed below *includes* the proposed CS9 improvements.

2. SCENARIOS MODELLED

As stated in TN2, the following scenarios have been tested as part of this VISSIM modelling exercise, as agreed with Momentum and TfL.

Table 1 – Modelled VISSIM Scenarios

No.	Scenario Name	VISSIM Scenario No.
1	Future Baseline (Existing TfL VISSIM model, including CS9 proposals)	19, 20
2a	Future Baseline + Proposed Blythe Road Signalisation	37, 38
3a	Future Baseline + Proposed Olympia Development	39, 40
4a	Future Baseline + Proposed Olympia Development + Proposed Blythe Road Signalisation	41, 42
5a	Future Baseline + Proposed Olympia Development + Proposed D-Gate Signalisation	43, 44
6a	Future Baseline + Proposed Olympia Development + Proposed Blythe Road Signalisation + Proposed D-Gate Signalisation	45, 46

It should be noted that, for the purposes of this TN, the following scenario has not been compared and analysed following agreement with Momentum:

- Scenario 2a – Future Baseline + Proposed Blythe Road Signalisation.

3. CHANGES TO MODEL

A comprehensive list of the modification files created and their associated details can be found in Section 3 in TN2.

This TN focuses on the audit comments made by TfL and the respective changes made to address them.

Comments from TfL were received on 3rd October 2018 via Claire Farrow and a follow-on response to these comments was sent from Multimodal to TfL on 5th October 2018 (see **Appendix A** for email chain). A further response from TfL was provided by TfL on 28th November 2018 and the following headings below detail further model changes to answer TfL's remaining queries.

1) D-Gate Flows appear incorrect – should there be 0 flows out in the AM peak?

Multimodal have discussed this query with Momentum Transport Planning and can confirm that the flows are 0 in the AM peak and 6 in the PM peak. The reasoning for this is stated below, from an email received from Momentum following their discussions with TfL (email from [REDACTED] p Multimodal sent on 30/11/18 at 09:19):

“Just to confirm on the modelled D-Gate flows (0 in and 0 out in the morning; 0 in and 6 out in the evening).

D-Gate is the exhibition visitor proposed car park access. Exhibition visitors have specific profiles linked to the opening and closing times of the shows which are outside of network peaks and specifically the peak hours modelled in VISSIM.

We agreed these profiles with the spatial team at TfL and it was also highlighted to the network performance team at the time of the modelling. You'll see in the attached email from July that the agreed trip generation methodology leads to zero arrivals for the AM peak and 3% departures for the PM evening (because the 3% is from 1700 and 1800 and our model is 1745-1845, we have 'pushed' the 3% into the model times to test a worst case). 181 spaces car park x 3% of departures = 6 vehicles out during the PM peak.”

Further details on the email exchanges regarding this query can be provided if necessary.

2) Behaviour of Cyclists at D-Gate junction – very slow on exit?

TfL's main query related to the link having different widths through the junction, which could have affected the behaviour. Multimodal have undertaken a review of the link structure and can confirm that the cycle links are the same width through D-Gate (when signalised). For the scenarios where D-Gate is priority controlled, the cycle link structure and behaviours have been kept consistent with TfL's 'Proposed AM/PM V2' models.

Our standard modelling methodology when working with pre-approved models is to make no changes to the model set-up, unless specifically instructed to do so and with solid, agreed reasoning. In keeping with this approach for the cyclist behaviour, no further changes have been made to the models and further advice is sought from TfL if changes are required above the approved 'Proposed AM/PM V2' models.

3) North End Road cyclist numbers require attention – vary between scenarios?

Following a review of the cyclist flows, Multimodal can confirm that Scenarios 3a and 5a have the correct cyclist flows. For Scenarios 4a and 6a, as a result of the closure of Munden Street to 'Entry Only' traffic, the vehicles which previously entered the network from this approach were reassigned to North End Road. However, a review of the calculation of these inputs has revealed an error in the number of cyclists calculated. The updated calculations for the North End Road vehicle inputs can be found in **Appendix B**, Modification Files 96 and 97 have been updated and the models have been re-run for new results.

4) Northbound link at Munden Street – differences between scenarios?

In scenarios 4a and 6a, this approach is 'Entry Only' in line with Momentum's mitigation proposals. This was confirmed by Momentum in an email from [REDACTED] on 24/07/18 at 12:52, which stated:

"...when Blythe road is signalised Munden Street becomes entry only from Hammersmith Road."

4. RESULTS

To compare the effects in the network of the various scenarios, the following outputs have been obtained as agreed with TfL:

- Journey Times (for General Traffic, Buses, Cyclists)
- Queue Lengths (Average Queues at each junction in the network)
- Saturation Flows (for each approach at each signalised junction in the network)
- Overall Network Performance

In line with previous CS9 modelling, the following random seeds have been run:

Table 2 – Random Seed Runs

Peak	AM	PM
Starting Seed	42	42
Increment	1	19
No. of Runs	20	20

Journey Times

Journey times 9000-9056 have been obtained for the same sections used in the CS9 assessment, as agreed with TfL. Numbers 200-202 have also been obtained following correspondence with TfL. For reference, the journey time sections are listed in **Table 3** and shown in **Figure 2**.

AM Results

In the AM peak, **Table 4** shows that when comparing against SC1, SC3a has the least impact (adding Olympia development, no signalisation schemes) for all modes (general traffic, buses and cyclists). This seems to indicate that by reassigning traffic using Olympia Way to Blythe Road, the network journey times are affected, but not to the same degree as the other scenarios. The maximum increases are around 2 minutes for traffic and buses and 9 seconds for cyclists.

The introduction of signals at Blythe Road (SC4a), D-Gate (SC5a) or both junctions (SC6a) tends to have a greater impact on the journey times for all modes of travel. This is particularly noticeable for SC4a and SC6a for westbound journey times on Hammersmith Road (no's 9002, 9018), where increases of ~3.5 minutes were experienced for traffic and buses and 0.5-1.5 minutes for cyclists (no's 9004, 9020).

In an eastbound direction, SC6a experiences significant increases for cyclists (~7-8 minutes for no's 9003, 9019), with SC6a and SC5a having similar effects on general traffic and buses (3.5-4 minutes for no's 9001, 9017, 9048). SC4a had less of an impact on general traffic and buses (2-3 minutes), but similar impacts on cyclists as SC6a. SC5a had less of an impact on cyclists (max times of 1-3.5 minutes as opposed to 7-8 minutes).

From North End Road, the journey time impacts on traffic travelling eastbound are minimal, with SC3a, SC4a and SC5a all producing slight reductions in times of between ~10 and 20 seconds. SC6a has a slight increase in journey time (6 seconds). For buses, the biggest impacts are in SC4a and SC6a, where travelling westbound (no. 201), there are increases of ~2 minutes. Cyclists are most affected in SC5a, where there is an increase of nearly 4 minutes travelling eastbound (no. 200).

Across all the scenarios, there are some slight improvements (up to 23 seconds for SC6a) to general traffic and bus journey times for traffic travelling from Olympia to Holland Road (no. 9055). Travelling in the other direction (no. 9056), SC4a and SC6a have the biggest increases of 20-60 seconds across all modes of travel.

PM Results

In the PM peak, **Table 5** shows that all scenarios show increases in general traffic and bus journey times for eastbound and westbound routes on Hammersmith Road (no's 9001, 9002, 9017, 9018, 9048). The increases range from 30 seconds to 10 minutes for traffic and buses, with SC4a and SC6a the worst performing. For cyclists, SC3a shows similar or slightly improved times eastbound (No's 9003, 9019, 9050), with SC4a, SC5a and SC6a showing modest increases of 14 seconds to 1 minute. In a westbound direction (No. 9004, 9020), SC5a is the most noticeable, with increased times of ~3 minutes in comparison to ~30 seconds to 2 minutes for the other scenarios.

Journey times from North End Road travelling eastbound (No. 200) were found to be improved for all scenarios when considering general traffic and buses, with savings ranging from 14 – 45 seconds. In a westbound direction (No. 201), SC4a and SC6a had more of an impact on buses, with increases of around 1.5 minutes. For cyclists, the results were mixed. SC5a and SC6a had the biggest impact travelling eastbound (~1.5 minutes) and SC4a had the biggest impact travelling westbound (~1 minute).

Comparing the different scenarios, SC3a and SC5a appear to have the least impact on general traffic and buses times. For cyclists, SC3a has the least impact, following by SC4a and then SC6a and SC5a.

As in the AM peak, there are some slight improvements (up to 31 seconds for SC6a) to general traffic and bus journey times for traffic travelling from Olympia to Holland Road (no's 9055). Travelling in the other direction (No. 9056), SC3a and SC5a have the least impact on travel times, but these are all increased in comparison to the base case.

Queue Lengths

Average queue lengths have been obtained for the junctions listed below and shown in **Figure 3**:

- J1 – Hammersmith Rd / Avonmore Rd;
- J2 – Hammersmith Rd / North End Rd;
- J3 – Hammersmith Rd / Blythe Rd;
- J4 – Hammersmith Rd / Edith Rd;
- J5 – Hammersmith Rd / Brook Green;
- J6 – Hammersmith Rd / Shortlands;
- J7 – Hammersmith Rd / D-Gate;
- J8 – Kensington High St / Warwick Rd.

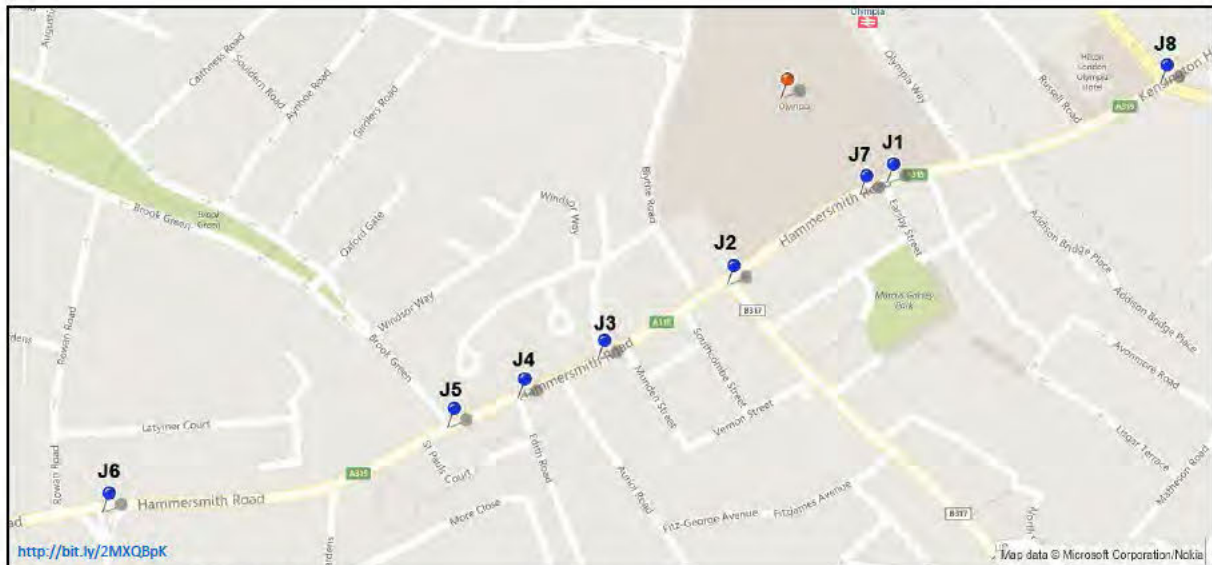

Figure 3 – Junctions Assessed

The comparisons for each junction are shown in **Figures 4-11** under the related sections.

J1 – Hammersmith Rd / Avonmore Rd

Figure 4 – Hammersmith Rd / Avonmore Rd Queue Comparisons

In the AM peak, the longest queues are on the Hammersmith Road East approach, with SC4a and SC6a (Blythe Road signalisation and both sets of signals) having the highest average queue lengths. Queues on Avonmore Road are the next longest and again, highest in SC4a and SC6a. Finally, the Hammersmith Road West approach has the lowest average queue lengths, with SC1 being the exception, which has longer queues.

The pattern of the queue results suggest that the introduction of the signals has a negative impact in the busier westbound direction, but a positive effect eastbound on Hammersmith Road.

In the PM peak, the Hammersmith Road East approach has the longest queues (~250m) in SC4a and SC6a. The queues plateau at this length which suggests that the queuing is back to the Kensington High St / Warwick Road junction for parts the PM peak period.

For the Hammersmith Road West approach, the average queue lengths are lower for all scenarios (compared to SC1), indicating some benefit with the signalisation proposals.

J2 – Hammersmith Rd / North End Rd

Figure 5 – Hammersmith Rd / North End Rd Queue Comparisons

In the AM peak, the North End Road approach queues reach as far back as the end of the link (~180m) and maintain this level throughout. This level of queuing is likely to result in latent demand on this approach, with vehicles not able to enter the network.

For the Hammersmith Road approaches, the results are mixed. On the East approach, SC3a and 5a have comparable queues with SC1, but SC4a and SC6a have much longer queues. However, for the West approach, SC4a and SC6a produce lower average queues (20-40m), with SC5a resulting in the highest average queue lengths (~80m). This suggests that the proposed signalisation of Blythe Road and D-Gate have mixed effects on this junction in the AM peak.

In the PM peak, the same effects are apparent as in the AM peak across all the approaches.

North End Road experiences a consistent queue of ~180m, reaching back as far as the end of the link and likely leading to latent demand from this approach as a result.

For the Hammersmith Road approaches, the East approach has longer queues in SC4a and SC6a (70-100m), with SC3a also experiencing higher queue lengths in this peak (~40m). SC5a has comparable queues with SC1, averaging out at ~30m in both scenarios.

For the West approach, the average queue lengths are higher for all scenarios, with SC4a and SC6a again having the shortest queues.

J3 – Hammersmith Rd / Blythe Rd

Figure 6 – Hammersmith Rd / Blythe Rd Queue Comparisons

In the AM peak, the average queues on Blythe Road are longest for SC6a (~90m), then SC4a (~75m) and then SC5a (~60m).

For the Hammersmith Road approaches, SC4a and 6a are significantly worse than the other scenarios for the East approach. As these scenarios propose signals on this approach, this would indicate the reason for the additional delay. For the West approach, the queue lengths for all the mitigation scenarios are similar, suggesting that there is not as much of an impact having signals on this approach (SC4a, SC5a and SC6a).

For Munden St, SC5a has the highest average queue lengths (~40m). SC4a and SC6a have no queues from this approach, as a result of the approach being closed, and traffic reassigned.

In the PM peak, the Blythe Road queues reach back to the start of the link for SC1, SC4a and SC5a (~110m). This occurs earlier in SC5a, indicating the likelihood of latent demand on this approach as a result. SC3a has the lowest queue lengths (~80m), with and SC6a having queues ~100m.

For the Hammersmith Road approaches, the results are mixed. On the East approach, SC4a and SC6a have the longest queues (as in the AM peak). For the West approach, the queue lengths are all similar at ~80m. This suggests that the queues reach back to the Edith Road junction on a consistent basis throughout the PM peak, except for the future baseline scenario (SC1).

On Munden St, the same results are apparent in the PM peak as the AM peak.

J4 – Hammersmith Rd / Edith Rd

Figure 7 – Hammersmith Rd / Edith Rd Queue Comparisons

In the AM peak, the queue lengths on the Hammersmith Road East approach are higher for SC5a and SC3a, with SC4a and SC6a having lower queue lengths than SC1. For the West approach, the queue lengths and profiles are more consistent between SC3a, SC4a and SC6a. SC5a has the longest average queues (~50m) and SC1 has the shortest (~5m).

For Edith Road, the queue lengths for all scenarios are minimal, at ~5m throughout the AM peak period.

In the PM peak, the Hammersmith Road East approach follows a similar pattern as the AM peak, with SC4a and SC6a having the lowest queue lengths and SC3a and SC5a having the highest. This suggests a benefit with the Blythe Road signals. For the West approach, the average queue lengths are higher than in the AM peak, with SC3a, SC4a, SC5a and SC6a experiencing the larger queues (55-65m on average). Scenarios with queues over 50m suggest an interaction with the Brook Green junction, which is ~50m away from the Edith Road junction.

For Edith Road, the average queue lengths are again minimal for all scenarios, averaging out at around 5m.

J5 – Hammersmith Rd / Brook Green

Figure 8 – Hammersmith Rd / Brook Green Queue Comparisons

In the AM peak, the Brook Green approach has the longest queues in SC5a (peaking at ~50m), with the remaining scenarios having the lowest queues at around 20m. This suggests some benefit with the Blythe Road signals in place.

For the Hammersmith Road approaches, the results are mixed. For the East approach, the queues for all scenarios are minimal at ~15m. However, for the West approach, the average queue lengths plateau at ~300m for all scenarios (except the future baseline – SC1). This suggests heavy queuing which reaches back beyond the Shortlands junction.

In the PM peak, the queues on Brook Green for SC3a and SC5a reach back to the start of the link (~140m) and remain at that level for the whole peak period. This is likely to lead to latent demand on this approach as a result. SC4a and SC6a have queues that build, but only reach up to 75m.

For the Hammersmith Road approaches in the PM peak, the same effects are present as in the AM peak. For the East approach, the queue lengths are slightly higher on average (at around 30-40m). For the West approach, the significant queuing is again present, maintaining a length of 300m, suggesting downstream queuing beyond the Shortlands junction. The exception is the future baseline (SC1), which has average queuing around 40m.

J6 – Hammersmith Rd / Shortlands

Figure 9 – Hammersmith Rd / Shortlands Queue Comparisons

In the AM peak, the Hammersmith Road East approach has queues up to 20-30m for all scenarios.

For Hammersmith Road West, the queues for SC4a, SC5a and SC6a scenarios reach back as far as the end of the link (~180m). This occurs earlier in the peak for SC6a and SC5a, with latent demand likely as a result. Queues for SC3a increase as the peak progresses, but do not reach as far (~160m).

For the Shortlands approach, the queues are minimal for all scenarios, averaging around 10m.

In the PM peak, both Hammersmith Road approaches experience the same levels of queuing. For the East approach, all scenarios have average queue lengths of 20-30m. For the West approach, the queue lengths for SC4a and SC6a rise to 180m and plateau, suggesting latent demand also likely from this approach. SC5a and SC3a have lower average queue lengths, of up to 160m and 110m respectively.

The average queues on the Shortlands approach are minimal, averaging around 5m for all scenarios.

J7 – Hammersmith Rd / D-Gate

Figure 10 – Hammersmith Rd / D-Gate Queue Comparisons

In the AM peak, queues on the D-Gate approach are minimal, with very little traffic exiting this approach.

On the Hammersmith Road East approach, the introduction of signals at Blythe Road, D-Gate or both (SC4a, SC5a, SC6a) increases the queue lengths on this approach. SC4a and SC6a provide the biggest increase with queues averaging 40-50m. On the West approach, SC5a and SC6a have the longest queues (~70m), with SC3a reaching 60m in length and SC4a averaging ~40m. This indicates that the introduction of signals at D-Gate does have an effect. SC1 has no queue lengths as this junction was not included within the future baseline scenario.

In the PM peak, the D-Gate queues are minimal, replicating the AM performance.

For Hammersmith Road, the East approach has higher average queue lengths with SC4a and SC6a the longest (~60-70m). SC5a has average queues up to 35m in length, whilst SC3a has the lowest (~10m). For the West approach, SC5a and SC6a have the longest queues (40-50m), with SC3a having the lowest queue lengths with the Olympia development included.

J8 – Kensington High St / Warwick Rd

Figure 11 – Kensington High St / Warwick Rd Queue Comparisons

In the AM peak, all scenarios have a consistent average queue length and profile on the Kensington High Street East approach.

For Kensington High St West, SC1 is the worst performing, with average queues reaching ~140m at their peak. The scenarios with the proposed signals (SC4a, SC5a and SC6a) produce the lower queue lengths, likely due to traffic being held up further downstream in the network.

On Warwick Road, the approach queuing is consistent for all scenarios, with an eventual build up to ~90m as queues reach back from the Avonmore Road junction.

In the PM peak, there are big differences in queuing on the Kensington High St East approach. SC4a and 6a have queues which build back to the start of the link (~340m). This is likely due to queuing back at the Avonmore Road junction (see **Figure 4**) and will likely lead to latent demand on this approach in these scenarios. SC3a and SC5a have much lower queuing levels, averaging 20-40m.

For the West approach of Kensington High St, the queuing profiles are similar to the AM peak, with SC1 producing the highest average queue lengths (~100m). The other scenarios have smaller queues, suggesting traffic is being held up further downstream for SC4a, SC5a and SC6a.

The Warwick Road approach queuing is fairly consistent for SC6, 7, 8 and 9, with an eventual build up to ~150m as queues reach back from the Avonmore Road junction.

Saturation Flows

Saturation flows have been obtained at the following signalised junctions as listed below and shown in **Figure 3**:

- J2 – Hammersmith Rd / North End Rd;
- J3 – Hammersmith Rd / Blythe Rd;
- J4 – Hammersmith Rd / Edith Rd;
- J5 – Hammersmith Rd / Brook Green;
- J6 – Hammersmith Rd / Shortlands;
- J7 – Hammersmith Rd / D-Gate;
- J8 – Kensington High St / Warwick Rd.

The results of the AM and PM comparisons are shown in **Tables 6 and 7**, which have been based on the following Saturation Flow criteria from TfL's 'VISSIM Saturation Flow Tool' (see **Figure 12**). The criteria has been based on the TfL Guidance Notes, with adjustments made to the 'General Parameters' section to obtain as many readings as possible from the VISSIM results.

Tool Settings for Saturation Flow Measurement	
<u>General Parameters:</u>	
Number of vehicles across stopline to ignore at start of green	<input type="text" value="2"/>
Minimum number of vehicles required in a single measurement	<input type="text" value="6"/>
Minimum number of measurements for average sat flow calculation	<input type="text" value="5"/>
Global PCU Factor (adjust for specific links on survey/results sheets)	<input type="text" value="1.00"/>
<input type="button" value="Test these settings on an individual Axx/Dis file"/> (Select Axx file) <input type="button" value="Run with these settings on multiple Axx/Dis files"/> (Select VISSIM model file)	
<u>Time Parameters:</u>	
Include measurements from time	<input type="text" value="0"/> s
Disregard measurements after time	<input type="text" value="7200"/> s
<input type="button" value="Clear Survey Data"/> <input type="button" value="Clear Results Data"/>	
<u>End of Saturation:</u>	
End of saturation is assumed when any of the following occur (tick as appropriate):	
<input checked="" type="checkbox"/> Headway is greater than	<input type="text" value="3.5"/> s
<input checked="" type="checkbox"/> Increase between successive headways exceeds	<input type="text" value="175"/> %
<input checked="" type="checkbox"/> (Max headway + min headway) greater than	<input type="text" value="3.50"/>
Do not assume the above values are 'standard' values which are correct in all cases. They must be tested for suitability on a variety of links in the network concerned, and adjusted as necessary.	

Figure 12 – Saturation Flow Criteria for TfL's VISSIM Saturation Flow Tool

Table 6 – Saturation Flow Comparisons – AM Peak

		Kens. High St West - Ahead	1797	1802	1762	1766	1704	0%	-2%	-2%	-5%
		Kens. High St West - LT	-	-	-	-	-	-	-	-	-

From **Table 6**, the main junctions affected in a negative way by the proposals are the Hammersmith Road junction with Edith Road, with decreases in saturation flows of 3-7%.

At the North End Road junction, there are some benefits over SC1, with saturation flow increases up to 11% for the Hammersmith Road West approach in SC4a. This appears to suggest that the signals are improving the flow eastbound on Hammersmith Road through this section of the network.

Comparing the different scenarios, SC3a shows the least variance in saturation flow, with the percentage changes ranging from +5% to -3%. SC4a, SC5a and SC6a show more variance, with ranges of +11% to -4%, +7% to -7% and +9% to -6% respectively.

For the Shortlands and Kensington High St junctions, the saturation flow changes were minimal between the scenarios. The only approach of note is the High Street West approach at the Kensington High Street junction, where SC4a, SC5a and SC6a had decreases of 2%, 2% and 5% respectively.

There were a large number of stop-lines where saturation flows could not be obtained. This was due to the outputs from VISSIM not satisfying the criteria as shown in **Figure 12**.

Table 7 – Saturation Flow Comparisons – PM Peak

PM PEAK (1745-1845)

		Warwick Rd - LT	-	-	-	-	-	-	-	-	-
		Kens. High St West - Ahead	-	-	-	-	-	-	-	-	-
		Kens. High St West - Ahead	-	-	-	1679	-	-	-	-	-
		Kens. High St West - LT	-	-	-	-	-	-	-	-	-

From **Table 7**, there is much more variance in the saturation flow, with higher percentage differences than in the AM peak data.

The Hammersmith Road West approach at the Edith Road junction is most affected, particularly in SC4a and SC6a, where there is an 18% and 17% reduction in saturation flow. In terms of positive impacts, the Hammersmith Road West approach in SC5a and SC6a has saturation flows which increase by 16%. As in the AM peak, this may be due to the signals at Blythe Road, which is having a positive impact on the eastbound movement in this section of the network.

When comparing the different scenarios, SC3a shows the least variety of saturation flow changes (+9% to -11%), followed by SC5a (+16% to -8%). SC6a performs slightly better than SC4a (+16% to -17% compared to +10% to -18%)), indicating that having both set of signals is a slightly better option than just having the Blythe Road signals in terms of vehicle throughput.

There were a large number of stop-lines where saturation flows could not be obtained, similar to the AM peak. This was due to the outputs from VISSIM not satisfying the criteria as shown in **Figure 12**.

Overall Network Performance

The overall network performance of the scenarios has been compared, to give an overall picture of how the different networks perform in terms of average delay, average speed and latent demand and delay.

The AM and PM results are shown in **Tables 8 and 9**.

Table 8 – Network Performance Comparisons – AM Peak

NETWORK PERFORMANCE								
AM Peak (0745-0845)								
Scenario	Average Delay (s)			Average Speed (mph)			Latent Delay (hrs)	Latent Demand
No.	Traffic	Buses	Cyclists	Traffic	Buses	Cyclists	All Vehs	All Vehs
1	136	214	154	9	7	9	1	62
3a	160	252	155	8	6	9	2	79
4a	210	335	383	7	5	5	5	216
5a	188	292	283	7	6	6	2	128
6a	222	359	411	7	5	4	5	250

NETWORK PERFORMANCE - comparison vs. SC1								
AM Peak (0745-0845)								
Scenario	Average Delay (s)			Average Speed (mph)			Latent Delay (hrs)	Latent Demand
No.	Traffic	Buses	Cyclists	Traffic	Buses	Cyclists	All Vehs	All Vehs
3a	24	38	1	-1	-1	0	0	17
4a	74	120	230	-2	-2	-5	3	155
5a	52	78	129	-2	-1	-3	1	67
6a	86	145	258	-3	-2	-5	4	188

**Some values different due to rounding in Excel*

In the AM peak, it can be seen that in terms of average delay, SC4a and 6a have the biggest impact compared to SC1. SC3a has minimal impact and SC5a is the better performing of the three mitigation scenarios (SC4a, SC5a and SC6a). Buses and cyclists are most affected, which may be due to the changes made in introducing signals at Blythe Road and a combination of Blythe Road and D-Gate signals.

This trend is repeated for the average speed comparisons, where the network speeds are lower for SC4a and 6a. This is particularly of note for cyclists, which are likely to have been affected by additional signals holding them within the network.

In terms of latent demand and associated latent delay, all of the scenarios show an increase over SC1. SC3a performs the best with only a slight increase, whilst SC6a shows the greatest impact. As with the other results, SC5a (D-Gate signals only) is the better performing of the three mitigation options, with 67 unreleased vehicles within the network during the peak period (compared to 155 and 188 vehicles in SC4a and SC6a).

Table 9 – Network Performance Comparisons – PM Peak

NETWORK PERFORMANCE								
PM Peak (1745-1845)								
Scenario	Average Delay (s)			Average Speed (mph)			Latent Delay (hrs)	Latent Demand
No.	Traffic	Buses	Cyclists	Traffic	Buses	Cyclists	All Vehs	All Vehs
1	134	219	165	9	7	8	1	37
3a	169	296	189	8	6	8	1	78
4a	274	554	329	5	3	5	6	336
5a	198	346	262	7	5	6	3	165
6a	273	540	348	5	3	5	6	345

NETWORK PERFORMANCE - comparison vs. SC1								
PM Peak (1745-1845)								
Scenario	Average Delay (s)			Average Speed (mph)			Latent Delay (hrs)	Latent Demand
No.	Traffic	Buses	Cyclists	Traffic	Buses	Cyclists	All Vehs	All Vehs
3a	35	77	24	-1	-2	-1	0	41
4a	141	335	164	-4	-4	-3	5	299
5a	65	127	97	-2	-2	-2	2	128
6a	139	321	182	-4	-4	-4	5	308

**Some values different due to rounding in Excel*

In comparison to the AM peak, the average delay per vehicle is higher for all scenarios, indicating a more congested network. As a result of the congestion, the increases in average delays for all scenarios are much higher than in the AM peak. Comparing the scenarios to SC1, SC3a is again the scenario with the least impact and SC5a gives the more favourable results out of the mitigation scenarios. Scenarios 4a and 6a have the greatest impact, with both adding around 5 minutes of delay to Buses and 3 minutes to Cyclists within the peak hour.

Due to the more congested network, the average speeds of the different modes are also lower in comparison to the AM peak. SC4a and SC6a affect speeds the most, with general traffic and buses particularly affected by the signals proposed. SC3a performs slightly better than SC5a, particularly against Traffic and Cyclist speeds.

In terms of latent demand and associated latent delay, all of the scenarios show an increase over SC1. Comparing the scenarios, SC3a has the least impact, whilst SC4a and SC6a has the greatest overall impact. As with the other results, SC5a (D-Gate signals only) is the better performing of the three mitigation options, with 128 unreleased vehicles within the network during the peak period.

5. SUMMARY & CONCLUSIONS

This technical note (TN) details the VISSIM modelling undertaken for Momentum Transport Consultancy for the proposed Olympia Exhibition Centre development in Hammersmith, London.

The VISSIM modelling has been based on Transport for London's (TfL's) model of Hammersmith, which has been used to test the Cycle Superhighways proposals (CS9) in the area.

This TN builds upon TN2, which detailed revised testing following changes to the flow assumptions and scenarios modelled. Since that submission, TfL have provided audit comments on the modelling and this note addresses the model changes and the updated results.

The modelling scenarios tested and analysed in this TN were as follows:

- Scenario 1 – Future Baseline
- Scenario 3a – Future Baseline + Proposed Olympia Development
- Scenario 4a – Future Baseline + Proposed Olympia Development + Proposed Blythe Road Signalisation
- Scenario 5a – Future Baseline + Proposed Olympia Development + Proposed D-Gate Signalisation
- Scenario 6a – Future Baseline + Proposed Olympia Development + Proposed Blythe Road Signalisation + Proposed D-Gate Signalisation

To compare the effects in the network of the various scenarios, the following outputs have been obtained as agreed with TfL:

- Journey Times (for General Traffic, Buses, Cyclists)
- Queue Lengths (Average Queues at each junction in the network)
- Saturation Flows (for each approach at each signalised junction in the network)
- Overall Network Performance

From the results collected, in terms of traffic related performance and impact, there was no scenario which clearly and conclusively showed comparability with SC1 across all of the results collected.

From a network performance and journey time perspective, SC3a and SC5a appear to perform better than SC4a and SC6a, but these still result in a worsened level of performance against SC1 overall. For queue lengths and saturation flows, the results are much more varied. The different scenarios have advantages and disadvantages over SC1 and each other, depending on the junction and approach considered. This makes it difficult to draw suitable conclusions as to which scenario gives the better performance overall from a traffic modelling perspective.

Further consideration should be given to the pros and cons of the proposals against other external factors (such as safety of all road users), to identify the preferred scenario against a wider range of criteria.

Subject: RE: Olympia models - comments

Hi Claire,

Please see response below on the latest modelling comments.

D-Gate Flows

Response previously provided in email to Claire Farrow on 05/10/18 at 12:33 – flows based on numbers provided by Momentum. **Is it possible momentum are incorrect? It seems unlikely there would be 0 flow out of D-gate so this can be raised with Momentum.**

Cyclist Numbers on North End Road

Response previously provided in email to Claire Farrow on 05/10/18 at 12:33 – issue acknowledged and to be corrected in revised modelling. **Ok.**

Scenario 3a & 4a – Cyclist Behaviour

The behaviour at the bus stops on eastbound exit of both D-Gate and Blythe Road has been based on the bus stop behaviour on Link 29 in TfL's approved 'Future Base AM/PM' models (SC16 & 17). This was to ensure consistency with TfL's approved modelling.

At the time, we did try using 'Urban (motorised)' in line with the bus stop behaviour on Link 16 in TfL's approved 'Future Base AM/PM' models, but recall this showed similar issues. As a result, we opted for the specific bus stop behaviour to match TfL's models. **I think the behaviour was not so much the concern here but rather the width of the cycle track being inconsistent causing some issues as cyclists merge.**

Further advice is sought from TfL on this comment if changes are required above the approved 'Future Base AM/PM' models. We would also need to include our Client, Momentum, in these discussions as these

changes are considered 'out of scope'. It was always our intention to keep the cyclist behaviour and set-up consistent with the approved TfL models.

Scenario 3a & 4a – Leaving D-Gate

This comment is acknowledged and the priority rules will be reviewed to create more opportunities for right turning traffic to leave D-Gate when Hammersmith Road is queuing westbound. **Ok.**

Scenario 5a – D-Gate Signals

In scenarios where D-Gate is signalised, the staging chosen has been deemed the most efficient way of operating the junction to reduce delays. However, if TfL have suggestions to improve the operation through a reconfigured signal set-up, then comments/information on this is welcome. **We will look into this further to see if we can identify any improvements.**

-

Priority Rules

Response previously provided in email to Claire Farrow on 05/10/18 at 12:33 – this is deliberate and as a result of how the modification files are read for the various scenarios tested. **Ok.**

Large Input Flows

It is not clear which flows TfL are referring to for this comment. The only changes made to the inputs for this piece of work have been the inclusion of 'OlymDev' flows for the associated scenarios (SC3a, 4a, 5a, 6a). All other flows have been kept consistent with TfL's approved 'Future Base AM/PM' models (SC16 & 17).

Generally traffic flows in the warm-down period (final 1800 seconds of the model I assume) are lower than usual counts – in order for the model to clear out, however, in this case this doesn't appear to be happening.

-

If these flows are to change, then we would need to include our Client, Momentum, in these discussions as these changes are considered 'out of scope'. It was always our intention to keep all previous vehicle inputs consistent with the approved TfL models.

Hope this all helps and makes sense. However, if anything is unclear, please get in touch.

Kind regards,

■

Subject: RE: Olympia models - comments

Hi ■

Please see below for comments on Olympia models – without CS9 scenarios. There is a slight delay on

comments for scenario 6a but these will be with you by the end of next week. I thought I would send you these in the meantime. Quite a few of the comments are similar to those we had for the with CS9 scenarios and I know you have already provided a response to those. We will start going through those now while we await your response to the below comments. We will get back to you on all your responses for all scenarios once we have received them.

-

As in the with CS9 scenario:

- D-gate lack of flows?
- Cyclist numbers on North End Road query?

-

Scenario 3a & 4a:

AM – cyclists stuck behind buses at bus stop on eastbound exit of both D-gate and Blythe Road junctions – some turn left around the bus, some turn right. Behaviour seems a bit erratic/unrealistic?

PM – took a very long time for vehicles leaving D-gate to get out

Scenario 5a:

D-gate:

3 stages, less efficient than stand-alone crossing with give-way junction

- Main road
- Peds
- Side Road

The following Priority Rules do not affect any vehicle types as follows

- 1304
- 1305
- 1306
- 1307

Fairly large input flows during last 1800 seconds of model run during warm-down period, seems a bit strange.

Thanks.

Kind regards,

Claire Farrow

Hi [REDACTED],

Apologies for the delay in replying.

Yes we will get you our comments in the next 2 weeks on the 'without' CS9 scenarios and also address the comments on 'with' CS9 scenarios below.

Progressing with any revised modelling once you have received all comments for all scenarios is fine.

Thanks.

Hi Claire,

Further to my email below, I just wanted to check if we are due to be receiving further model audit comments for the Olympia modelling?

I only ask as the response below acknowledges the need for revised testing, but wanted to ensure you were not awaiting this updated modelling before providing any further audit comments? Our assumption was that we would receive all audit comments for the 'With' and 'Without' CS9 testing before progressing with the revised modelling.

Hope that makes sense and thanks in advance.

Kind regards,

Subject: RE: Olympia models - comments

Hi Claire,

Thanks for your email.

I have provided some responses below on your comments.

Westbound approach at D-gate junction

A separate document has been attached showing the differences in the network layout between the scenarios in the location. It can be seen from the proposals for Scenarios 3a and 4a that a two-lane approach would not be representative of what is proposed. **Ok.**

D-Gate Flows

These values are correct and based on proposed development flows provided by Momentum. Appendix A of Multimodal's TN titled '*180802 03541 MM TN2 -C- Revised Olympia Proposal Testing*' provides the flow diagram. **Is it possible momentum are incorrect? It seems unlikely there would be 0 flow out of D-gate so this can be raised with Momentum.**

D-Gate Split Phasing

Split phasing of Phases A and B was a follow on from initial mitigation testing that had a separate right turn stage into D-Gate. However, revisions to the mitigation meant that this separate stage was no longer required, but the separate phases remained.

-
The comment on the PUA file is acknowledged and Phase A should start at 16s instead of 12s. However, this is unlikely to change the modelled results given the low flows into D-Gate and vehicles driving towards a priority rule to give-way to on-coming traffic.

The split phasing at Blythe Road for Phases C and D is also carried through from initial mitigation testing and has no impact on the revised mitigation results.

Ok.

Cyclist Behaviour

From a review of the link structure, the cycle links are the same width through D-Gate (when signalised). For the scenarios where D-Gate is priority controlled, the cycle link structure and behaviours have been kept consistent with TfL's 'Proposed AM/PM V2' models. **I think the behaviour was not so much the concern here but rather the width of the cycle track being inconsistent causing some issues as cyclists merge.**

Further advice is sought from TfL on this comment if changes are required above the approved 'Proposed AM/PM V2' models. We would also need to include our Client, Momentum, in these discussions as these changes are considered 'out of scope'. It was always our intention to keep the cyclist behaviour and set-up consistent with the approved TfL models.

Cyclist Numbers

Scenarios 3a and 5a have the correct cyclist flows. For Scenarios 4a and 6a, as a result of the closure of

Munden Street to 'Entry Only' traffic, the vehicles which previously entered the network from this approach were reassigned to North End Road. However, a review of the calculation of these inputs has revealed an error in the number of cyclists calculated and the models will need to be re-run for Scenarios 4a and 6a. **Ok.**

Northbound Link on Munden Road

In scenarios 4a and 6a, this approach is 'Entry Only' in line with Momentum's mitigation proposals. This was confirmed by Momentum, but unfortunately not updated on the drawing at the time of issuing the VISSIM models. Scenario 5a should have Munden Street attached to the network in the models that were submitted. **Ok – will this be updated?**

Priority Rules

This warning appears due to the way in which the different scenarios read the modifications in VISSIM's Scenario Manager. Rather than take out the priority rules, to then add them back in later on, these have simply been made to apply to no vehicle types. This was for Scenarios 5a and 6a, where the exit to D-Gate was replaced from a priority controlled exit to a signalised exit (which no longer needed the priority rules). **Ok.**

Hope this all helps and make senses. However, if anything is unclear, please get in touch.

Kind regards,

Subject: Olympia models - comments

Hi ■

Please see below for comments on Olympia models – with CS9 scenarios.

- Westbound approach at D-gate junction: On signalised scenarios 5a and 6a westbound has a 2 lane approach from Earsby Road as per design. In 3a however it goes from 2 lanes to 1 lane and back to 2. In 4a it is 1 lane until close to the stopline when it becomes 2 lanes. All the designs suggest this westbound section should be 2 lanes from Earsby Road up to the stopline. According to the drawing lane 1 should be ahead and right turn but appears to be only right turn in the model.

3a: 4a:

- D-gate: No flow in the AM models for D-gate input, and only 6pcu in the PM – is this correct?
- Is split phasing of movements necessary for phases A & B at the D-gate? This seems to imply that right turners would get a full green when opposed by ahead traffic (phase C) and therefore creating a conflict. They should presumably run together as one phase with right turners gap accepting until westbound traffic is stopped. An error in PUA file – westbound RT lane signalled in different phase and receives green before both ahead movements.
 - \$INTERSTAGE
 - INTERSTAGE_number : 10
 - Length [s] : 16
 - From stage : 4
 - To stage : 1
 - \$
 - F -127 0
 - G -127 0
 - A 12 127
 - B 16 127
 - C 16 127

A similar situation also exists with phases C & D on Blythe Rd (without the obvious opposing phase).

- Behaviour of cyclists at D-gate junction very slow on exit of junction. It could be that the width of the cycle track is inconsistent, this can cause stuttering behaviour as the cyclists “merge” – this should be dealt with by changing the cycle track width gradually with multiple links, rather than over a connector between a wide link and a narrow link
- Cyclist numbers significantly vary between scenarios at North End Road approach: Scenarios 4a and 6a have in the region of ~200 every 15 minutes, while scenarios 3a and 5a have ~30 every 15 minutes. This needs to be checked – which flow input is correct? This high cyclist numbers in 6a cause further problems due to D-gate being signalised in this option - cyclists are queuing back from the D-Gate junction and eventually blocking the North End Rd junction. This essentially causes the whole model to work incorrectly, making it hard to see any other potential problems. This does not happen in 5a the other scenario with D-gate signalised as the cycle flows are so much lower. We need to identify which cycle flow is correct. Queuing of cyclists also seems unrealistic. The long queues are a results of the limitations of VISSIM modelling, but I believe that if queues reached the length they are in the AM model on the westbound approach to both Blythe Rd and D-Gate, what you would actually see is more bunching & cyclists getting off the cycle superhighway and using the main road.
- Northbound link on Munden Road (opposite Blythe Road): In scenarios 4a, 5a, and 6a this link is not attached to the network (no connector), according to the drawing this should have a stopline set back followed by a give way to get onto Hammersmith Road. Only in 3a has this link been connected to network but presumably it should be in all scenarios.

- Priority rules – these rules were highlighted by VISSIM because they do not affect any vehicle types:
 - Rule 152
 - Rule 153
 - Rule 155
 - Rule 156

If you have any questions please let me know.

Kind regards,

Claire Farrow

[181004 Response to TfL Comments.docx](#)

Hi Claire,

Thanks for your email.

I have provided some responses on the comments below.

Westbound approach at D-gate junction

A separate document has been attached showing the differences in the network layout between the scenarios in the location. It can be seen from the proposals for Scenarios 3a and 4a that a two-lane approach would not be representative of what is proposed.

It should also be noted that for Scenarios 5a and 6a, the off-side lane travelling Westbound should be 'Right Turn' only, rather than 'Ahead and Right' as shown in the drawing. This 'Right Turn' only lane is what has been modelled in initial LINSIG models to inform the signal plans.

D-Gate Flows

These values are correct and based on proposed development flows provided by Momentum. Appendix A of Multimodal's TN titled '*180802 03541 MM TN2 -C- Revised Olympia Proposal Testing*' provides the flow diagram.

D-Gate Split Phasing

Split phasing of Phases A and B was a follow on from initial mitigation testing that had a separate right turn stage into D-Gate. However, revisions to the mitigation meant that this separate stage was no longer required, but the separate phases remained.

-

The comment on the PUA file is acknowledged and Phase A should start at 16s instead of 12s.

The split phasing at Blythe Road for Phases C and D is also carried through from initial mitigation testing and has no impact on the revised mitigation results.

Cyclist Behaviour

From a review of the link structure, the cycle links are the same width through D-Gate (when signalised). For the scenarios where D-Gate is priority controlled, the cycle link structure and behaviours have been kept consistent with TfL's 'Proposed AM/PM V2' models. Further advice is sought from TfL on this comment if changes are required above the approved 'Proposed AM/PM V2' models.

Cyclist Numbers

Scenarios 3a and 5a have the correct cyclist flows. For Scenarios 4a and 6a, as a result of the closure of Munden Street to 'Entry Only' traffic, the vehicles which previously entered the network from this approach were reassigned to North End Road. However, a review of the calculation of these inputs has revealed an error in the number of cyclists calculated and the models will need to be re-run.

Northbound Link on Munden Road

In scenarios 4a and 6a, this approach is 'Entry Only' in line with Momentum's mitigation proposals. This was confirmed by Momentum, but unfortunately not updated on the drawing at the time of issuing the VISSIM models. Scenario 5a should have Munden Street attached to the network in the models that were submitted.

Priority Rules

This warning appears due to the way in which the different scenarios read the modifications in VISSIM's Scenario Manager. Rather than take out the priority rules, to then add them back in later on, these have simply been made to apply to no vehicle types. This was for Scenarios 5a and 6a, where the exit to D-Gate was replaced from a priority controlled exit to a signalised exit (which no longer needed the priority rules).

Hope this all helps and make senses. However, if anything is unclear, please get in touch.

Kind regards,

1) Westbound approach at D-Gate

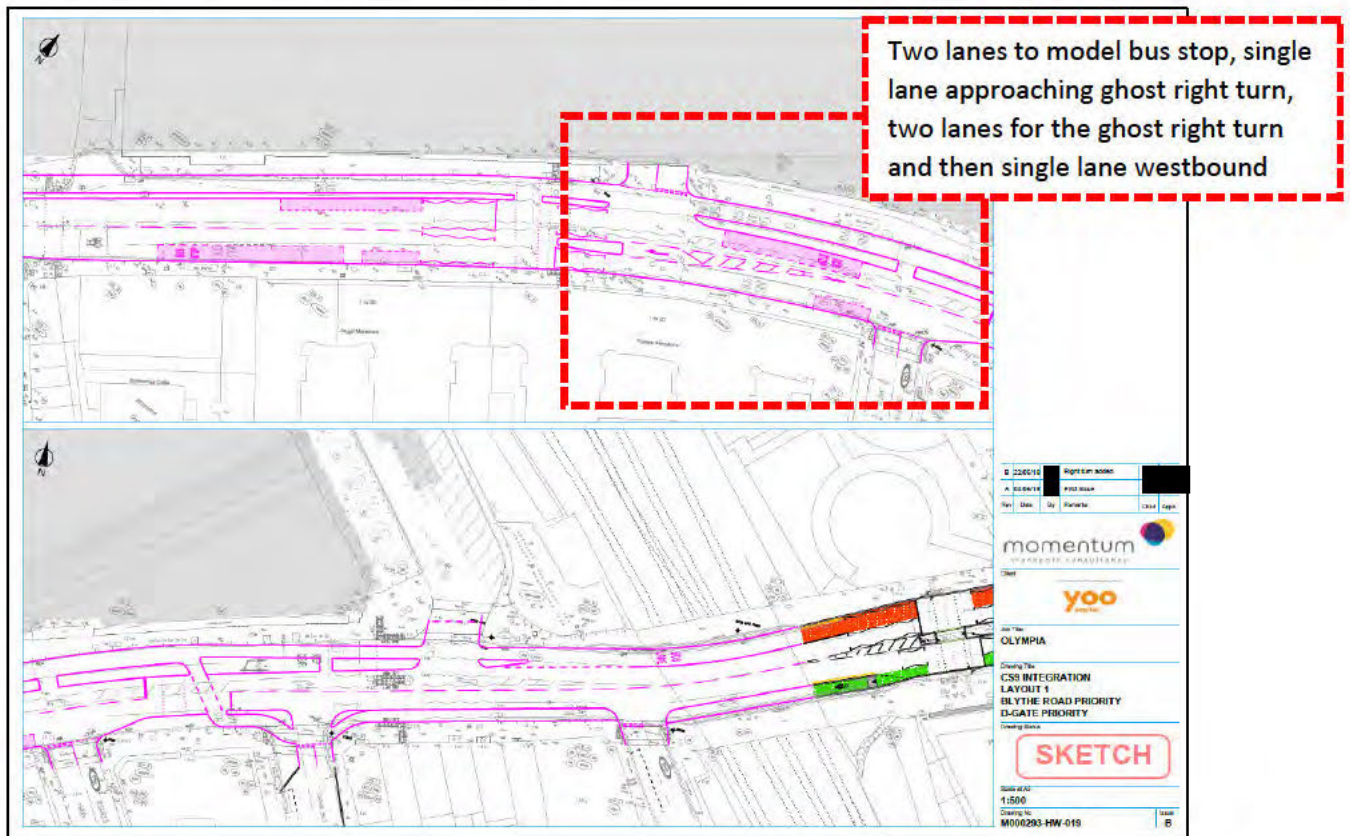

Sketches received from Momentum below show layouts of Westbound approach to D-Gate for the four different scenarios (highlighted in red boxes).

Scenarios 3a and 4a have a different road layout to Scenarios 5a and 6a, which is why the link structure is different.

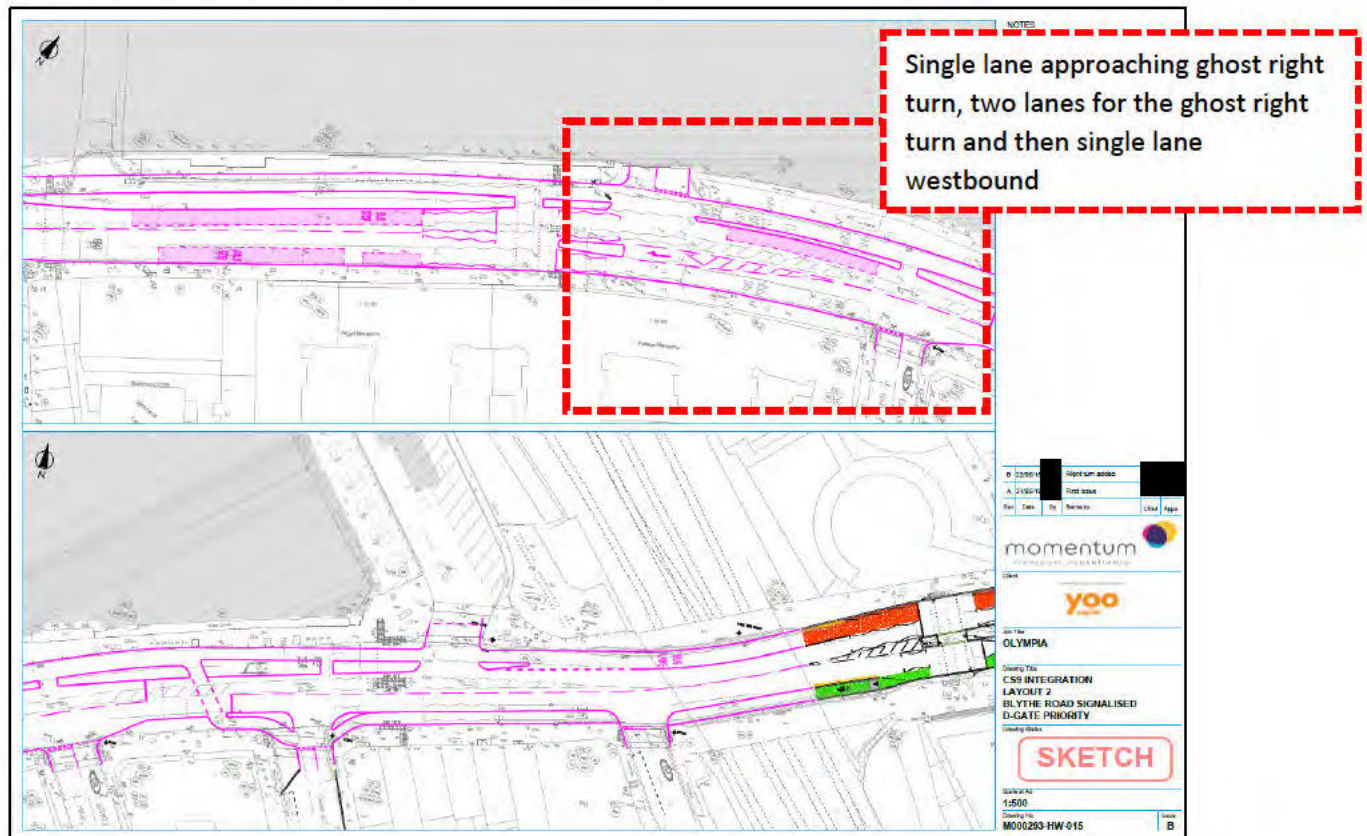

In Scenario 3a, the bus stop remains so the two-lane section includes for this before reducing to a single lane, two lanes for the ghost right turn and then a single lane that follows.

In Scenario 4a, the bus stop is relocated so a single lane is modelled up to the ghost right turn lane, before two lanes model the ghost right turn and a single lane then follows.

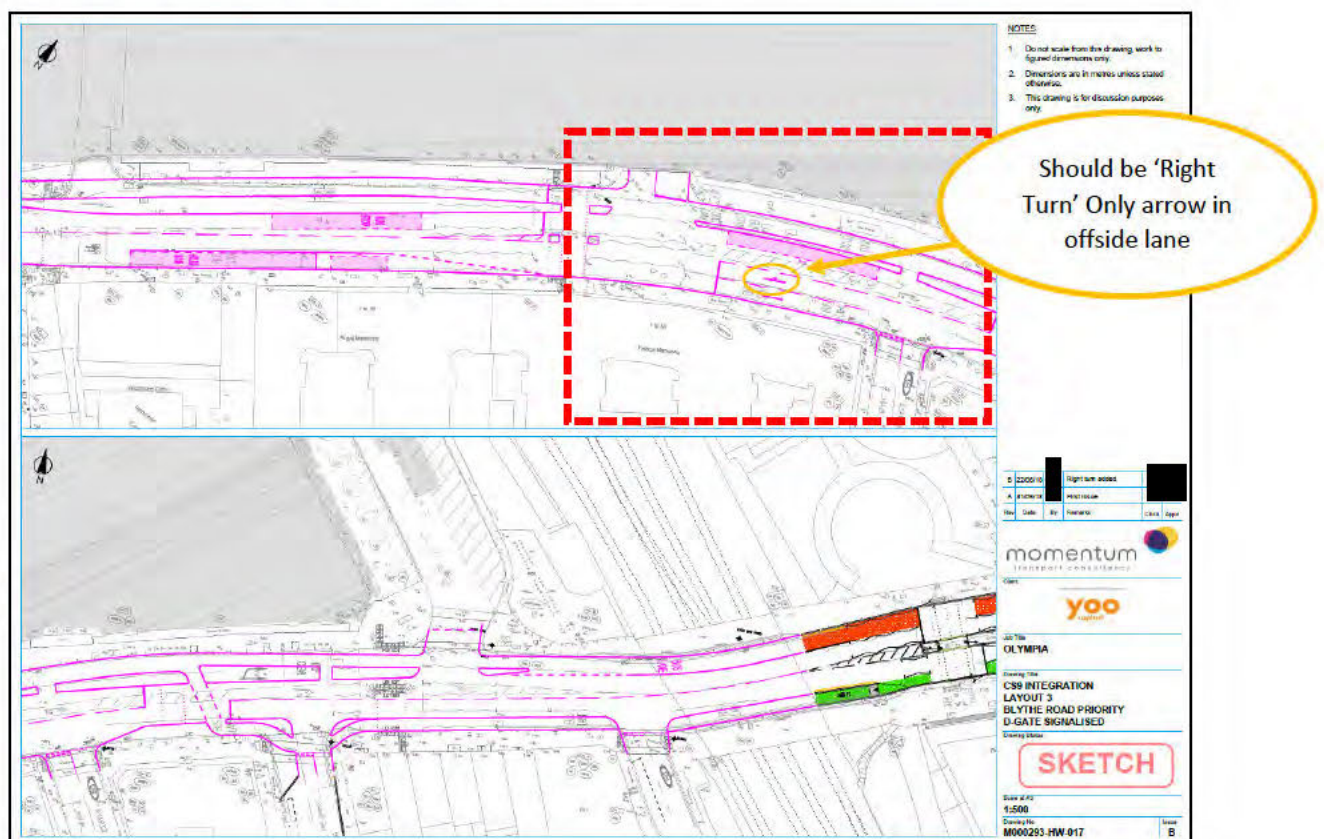

SC3a – Blythe Rd Priority, D-Gate Priority (with CS9)

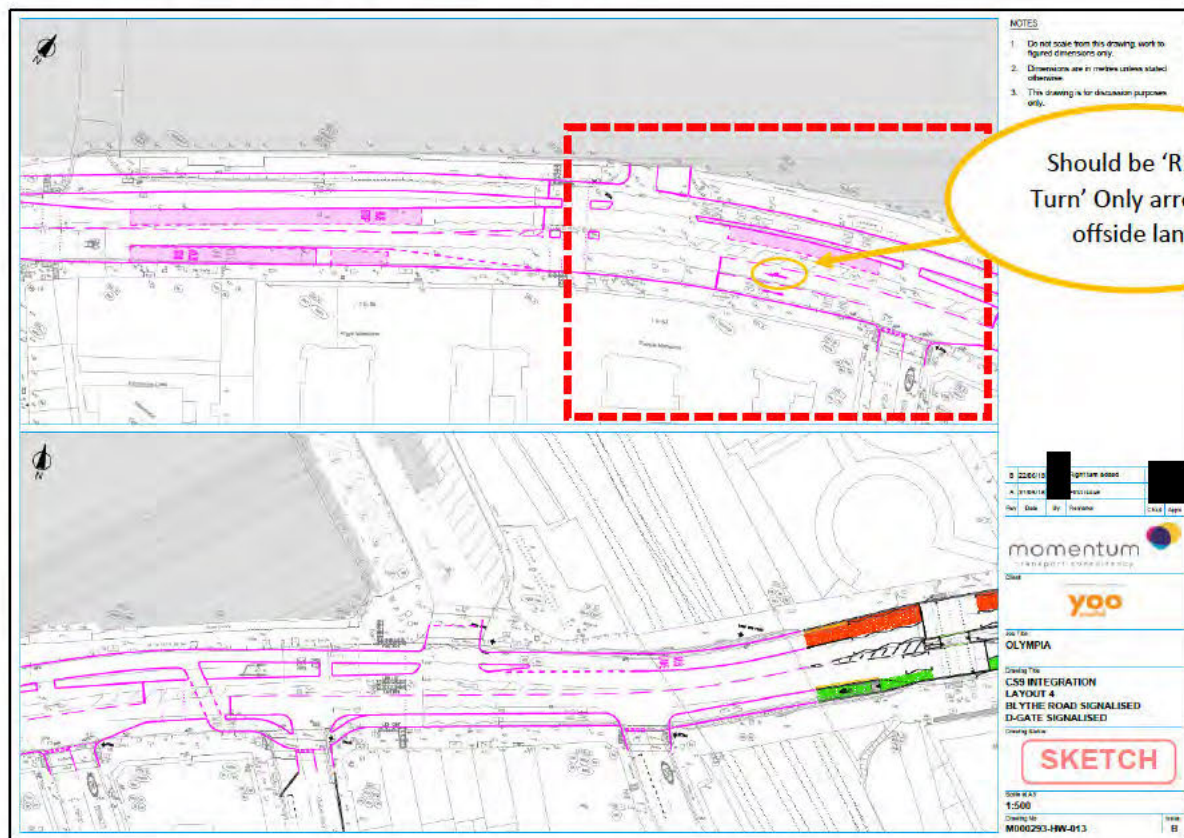

SC4a – Blythe Rd Signalised, D-Gate Priority (with CS9)

SC5a - Blythe Rd Priority, D-Gate Signalised (with CS9)

SC6a - Blythe Rd and D-Gate Signalised (with CS9)

 - \$
 - F -127 0

▪ G	-127	0
▪ A	12	127
▪ B	16	127
▪ C	16	127

A similar situation also exists with phases C & D on Blythe Rd (without the obvious opposing phase).

- Behaviour of cyclists at D-gate junction very slow on exit of junction. It could be that the width of the cycle track is inconsistent, this can cause stuttering behaviour as the cyclists “merge” – this should be dealt with by changing the cycle track width gradually with multiple links, rather than over a connector between a wide link and a narrow link
- Cyclist numbers significantly vary between scenarios at North End Road approach: Scenarios 4a and 6a have in the region of ~200 every 15 minutes, while scenarios 3a and 5a have ~30 every 15 minutes. This needs to be checked – which flow input is correct? This high cyclist numbers in 6a cause further problems due to D-gate being signalised in this option - cyclists are queuing back from the D-Gate junction and eventually blocking the North End Rd junction. This essentially causes the whole model to work incorrectly, making it hard to see any other potential problems. This does not happen in 5a the other scenario with D-gate signalised as the cycle flows are so much lower. We need to identify which cycle flow is correct. Queuing of cyclists also seems unrealistic. The long queues are a results of the limitations of VISSIM modelling, but I believe that if queues reached the length they are in the AM model on the westbound approach to both Blythe Rd and D-Gate, what you would actually see is more bunching & cyclists getting off the cycle superhighway and using the main road.
- Northbound link on Munden Road (opposite Blythe Road): In scenarios 4a, 5a, and 6a this link is not attached to the network (no connector), according to the drawing this should have a stopline set back followed by a give way to get onto Hammersmith Road. Only in 3a has this link been connected to network but presumably it should be in all scenarios.

- Priority rules – these rules were highlighted by VISSIM because they do not affect any vehicle types:
 - o Rule 152
 - o Rule 153
 - o Rule 155
 - o Rule 156

If you have any questions please let me know.

Kind regards,

Claire Farrow

Principal Network Manager – West (A4)

Network Performance – Delivery

My usual hours are 07:30-16:45 Monday & Tuesday, 08:30-16:15 Wednesday
